LISTING OF THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Please reconsider the claims as follows:

CLAIMS

- 1 1. (previously presented) A method for generating a composite EM field to carry a
- 2 signal to at least two terminals, the method comprising the step of directing energy in a
- plurality of directions, the amount of energy directed in the direction of each of the terminals
- 4 being a function of the locations and acceptable receive strengths of at least two of the
- 5 terminals, wherein the direction is an azimuth direction.
- 1 2. (original) The method of claim 1, wherein the function is such that a strength of the
- 2 EM field at the location of any of the at least two terminals is at least as large as, but not
- 3 significantly larger than, needed for that terminal to receive the signal carried by the EM field
- 4 with an acceptable level of signal quality.
- 1 3. (original) The method of claim 1, wherein the directing step comprises the steps of:
- determining for each one of the terminals an EM field that would have to be
- 3 generated for the one terminal in order to provide an acceptable receive strength thereat, the
- 4 determining taking into account the strength, at the location of the one terminal, of EM fields
- 5 previously determined for others of the terminals;
- 6 repeating the first determining step until the EM fields determined for the at least two
- 7 of the terminals provide an EM field strength for each of the at least two of the terminals that
- 8 is substantially equal to its adequate receive strength; and
- 9 determining the amount of energy to be directed in the direction of each of the
- 10 terminals based on the EM fields thus determined.
 - 1 4. (original) The method of claim 3, wherein:
 - 2 each EM field being represented by one of a plurality of beam-patterns;

471528-1

Serial No. 09/672,512 Page 3 of 13

- 3 the first determining step comprises determining for each one of the terminals a beam
- 4 pattern that would have to be generated for the one terminal in order to provide an acceptable
- 5 receive strength thereat, the determining taking into account the EM field strength, at the
- 6 location of the one terminal, of beam-patterns previously determined for others of the
- 7 terminals; and

Jul-24-2006 05:21pm

- 8 the repeating step comprises repeating the first determining step until the beam-
- 9 patterns determined for the at least two of the terminals provide an EM field strength for each
- 10 of the at least two of the terminals that is substantially equal to its adequate receive strength.
- 1 5. (original) The method of claim 4, wherein:
- 2 the beam-patterns being voltage beam patterns;
- 3 the acceptable receive strength being an acceptable receive voltage; and
- 4 the adequate receive strength being an adequate receive voltage.
- 1 6. (original) The method of claim 4, wherein one of a plurality of weight vectors
- 2 corresponds to each of the beam-patterns, and the second determining step comprises the
- 3 steps of:
- determining a composite weight vector using the plurality of weight vectors, and a
- 5 null-filling factor;
- 6 determining a composite beam-pattern using the composite weight vector, the
- 7 composite beam-pattern representing the composite EM field; and
- 8 determining the amount of energy to be directed in the direction of each of the
- terminals based on the composite EM field.
- 1 7. (original) The method of claim 1, wherein the directing step comprises the steps of:
- determining for each one of the terminals an EM field that would have to be
- 3 generated for the one terminal in order to provide an acceptable receive strength thereat if
- 4 that one terminal was the only terminal that needed to receive the signal;
- determining a scaling factor for each EM field such that each EM field, associated
- 6 with the at least two terminals, scaled by its scaling factor provides an EM field strength at
- 7 the location of each of these at least two terminals that is substantially equal to its adequate
- 8 receive strength;

Serial No. 09/672,512 Page 4 of 13

- 9 scaling each EM field, associated with the at least two terminals, by its scaling factor;
- 10 and
- determining the amount of energy to be directed in the direction of each of the
- 12 terminals based on the EM fields thus determined.
 - 8. (canceled)
- 1 9. (original) The method of claim 1, further comprising the step of transmitting the
- 2 energy.
- 1 10. (previously presented) A transmitter operable to generate a composite EM field to
- 2 carry a signal to at least two terminals by directing energy in a plurality of directions, the
- 3 amount of energy directed in the direction of each of the terminals being a function of the
- 4 locations and acceptable receive strengths of at least two of the terminals, wherein the
- 5 direction is an azimuth direction.
- 1 11. (original) The transmitter of claim 10, wherein the function is such that a strength of
- 2 the EM field at the location of any of the at least two terminals is at least as large as, but not
- 3 significantly larger than, needed for that terminal to receive the signal carried by the EM field
- 4 with an acceptable level of signal quality.
- 1 12. (original) The transmitter of claim 10, further comprising a processor operable to:
- 2 determine for each one of the terminals an EM field that would have to be generated
- 3 for the one terminal in order to provide an acceptable receive strength thereat, the
- 4 determining taking into account the strength, at the location of the one terminal, of EM fields
- 5 previously determined for others of the terminals;
- 6 repeat the first determining until the EM fields determined for the at least two of the
- 7 terminals provide an EM field strength for each of the at least two of the terminals that is
- 8 substantially equal to its adequate receive strength; and
- 9 determine the amount of energy to be directed in the direction of each of the terminals
- 10 based on the EM fields thus determined.

Serial No. 09/672,512 Page 5 of 13

- 1 13. (original) The transmitter of claim 12, wherein:
- 2 each EM field being represented by one of a plurality of beam-patterns;
- 3 the first determining comprises determining for each one of the terminals a beam
- 4 pattern that would have to be generated for the one terminal in order to provide an acceptable
- 5 receive strength thereat, the determining taking into account the EM field strength, at the
- 6 location of the one terminal, of beam-patterns previously determined for others of the
- 7 terminals; and
- 8 the repeating comprises repeating the first determining until the beam-patterns
- 9 determined for the at least two of the terminals provide an EM field strength for each of the
- 10 at least two of the terminals that is substantially equal to its adequate receive strength.
- 1 14. (original) The transmitter of claim 13, wherein:
- 2 the beam-patterns being voltage beam patterns;
- 3 the acceptable receive strength being an acceptable receive voltage; and
- 4 the adequate receive strength being an adequate receive voltage.
- 1 15. (original) The transmitter of claim 13, wherein one of a plurality of weight vectors
- 2 corresponds to each of the beam-patterns, and the second determining comprises:
- 3 determining a composite weight vector using the plurality of weight vectors, and a
- 4 null-filling factor;
- determining a composite beam-pattern using the composite weight vector, the
- 6 composite beam-pattern representing the composite EM field; and
- 7 determining the amount of energy to be directed in the direction of each of the
- 8 terminals based on the composite EM field.
- 1 16. (original) The transmitter of claim 10, further comprising a processor operable to:
- determine for each one of the terminals an EM field that would have to be generated
- 3 for the one terminal in order to provide an acceptable receive strength thereat if that one
- 4 terminal was the only terminal that needed to receive the signal;
- determine a scaling factor for each EM field such that each EM field, associated with
- 6 the at least two terminals, scaled by its scaling factor provides an EM field strength at the

Serial No. 09/672,512 Page 6 of 13

- 7 location of each of these at least two terminals that is substantially equal to its adequate
- 8 receive strength;
- 9 scale each EM field, associated with the at least two terminals, by its scaling factor;
- 10 and
- determine the amount of energy to be directed in the direction of each of the terminals
- 12 based on the EM fields thus determined.

17. (canceled)

- 1 18. (previously presented) An system comprising a transmitter operable to generate a
- 2 composite EM field to carry a signal to at least two terminals by directing energy in a
- 3 plurality of directions, the amount of energy directed in the direction of each of the terminals
- 4 being a function of the locations and acceptable receive strengths of at least two of the
- 5 terminals, wherein the direction is an azimuth direction.
- 1 19 (original) The system of claim 18, wherein the function is such that a strength of the
- 2 EM field at the location of any of the at least two terminals is at least as large as, but not
- 3 significantly larger than, needed for that terminal to receive the signal carried by the EM field
- 4 with an acceptable level of signal quality.
- 1 20. (original) The system of claim 18, further comprising a processor coupled to the
- 2 transmitter, the processor operable to:
- determine for each one of the terminals an EM field that would have to be generated
- 4 for the one terminal in order to provide an acceptable receive strength thereat, the
- 5 determining taking into account the strength, at the location of the one terminal, of EM fields
- 6 previously determined for others of the terminals;
- 7 repeat the first determining until the EM fields determined for the at least two of the
- 8 terminals provide an EM field strength for each of the at least two of the terminals that is
- 9 substantially equal to its adequate receive strength; and
- determine the amount of energy to be directed in the direction of each of the terminals
- 11 based on the EM fields thus determined.

- 1 21. (original) The system of claim 20, wherein the processor being located in the
- 2 transmitter.

Jul-24-2006 05:22pm

- 1 22. (original) The system of claim 20, wherein the system is a wireless communication
- 2 system having at least one MSC, and the processor being located in the MSC.
- 1 23. (original) The system of claim 20, wherein:
- each EM field being represented by one of a plurality of beam-patterns;
- 3 the first determining comprises determining for each one of the terminals a beam
- 4 pattern that would have to be generated for the one terminal in order to provide an acceptable
- 5 receive strength thereat, the determining taking into account the EM field strength, at the
- 6 location of the one terminal, of beam-patterns previously determined for others of the
- 7 terminals; and
- 8 the repeating comprises repeating the first determining until the beam-patterns
- 9 determined for the at least two of the terminals provide an EM field strength for each of the
- 10 at least two of the terminals that is substantially equal to its adequate receive strength.
- 1 24. (original) The system of claim 23, wherein:
- 2 the beam-patterns being voltage beam patterns;
- 3 the acceptable receive strength being an acceptable receive voltage; and
- 4 the adequate receive strength being an adequate receive voltage.
- 1 25. (original) The system of claim 23, wherein one of a plurality of weight vectors
- 2 corresponds to each of the beam-patterns, and the second determining comprises:
- 3 determining a composite weight vector using the plurality of weight vectors, and a
- 4 null-filling factor;
- determining a composite beam-pattern using the composite weight vector, the
- 6 composite beam-pattern representing the composite EM field; and
- determining the amount of energy to be directed in the direction of each of the
- 8 terminals based on the composite EM field.

Serial No. 09/672,512 Page 8 of 13

- (original) The system of claim 18, further comprising a processor coupled to the 26. 1
- transmitter, the processor operable to: 2
- determine for each one of the terminals an EM field that would have to be generated 3
- for the one terminal in order to provide an acceptable receive strength thereat if that one 4
- terminal was the only terminal that needed to receive the signal; 5
- determine a scaling factor for each EM field such that each EM field, associated with 6
- the at least two terminals, scaled by its scaling factor provides an EM field strength at the 7
- location of each of these at least two terminals that is substantially equal to its adequate 8
- receive strength; 9
- scale each EM field, associated with the at least two terminals, by its scaling factor; 10
- 11 and

Jul-24-2006 05:23pm

- determine the amount of energy to be directed in the direction of each of the terminals 12
- based on the EM fields thus determined. 13
- (original) The system of claim 18, further comprising an antenna operable to transmit 27. 1
- the energy.
- (original) The system of claim 27, wherein the antenna is a phased-array antenna. 28. 1
- (original) The system of claim 18, the system being a base station and the terminals 1 29.
- being mobile terminals.
- (original) The system of claim 18, the system being a wireless communication system 30. 1
- and the terminals being mobile terminals.
 - 31. (canceled)
